    The present sequence represents a fusion protein comprising LipoD-HIV-1 Tat. The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a vaccine to prevent HIV infection.

The present sequence represents a His-tagged ProtD-Nef-Tat fusion protein. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180

                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a His-tagged Nef-Tat linked protein of HIV, with a lipidation signal sequence (LipoD) which is removed after processing and a ProtD fusion partner. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     123

```
The present sequence represents a fusion protein comprising Lipob-HIV-1 Tat-His. The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a vaccine to prevent HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                      gene; Nef protein; Tat protein;
HIV Tat or Nef protein linked to a fusion partner
                                                                                                                                                                                                                                                                                                                                                               A representative LipoD-Tat-His fusion protein.

                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a fusion protein comprising LipoD-HIV-1 Nef. The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Tat protein. The fusion protein can be used in a vaccine to prevent HIV infection.

The present sequence represents a His-tagged ProtD-Nef fusion protein. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.

The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Tat protein. The fusion protein can be used in a vaccine to prevent HIV infection.

                                                                     The present sequence represents a His-tagged Nef protein of HIV, with a lipidation signal sequence (LipO) which is removed after processing. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat. HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophlactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV-gpl20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             243

```
The present sequence represents a representative HIV-1 Nef-Tat-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The fusion protein can be used in a vaccine to prevent HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       231

                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                 The present sequence represents a His-tagged Nef-Tat linked protein of HIV. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat. HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a
```

```
The present sequence represents a representative HIV-1 mutant Tat-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a vaccine to prevent HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          351

                                                                                                                                                                                                                                                                                                                                                                                     The protein is expressed in the yeast Pichla pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV 9p120 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gp120 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gp120.

```
The present sequence represents a representative HIV-1 Nef-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The specification also describes fusion proteins comprising HIV-1 Tat protein. The fusion protein can be used in a vaccine to prevent HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              291

This invention describes novel binding partners (A).(1) for negative factor protein (Nef) that competitively inhibit binding of calmodulin (I) to Nef, or (11) for (I) that competitively inhibit binding of Nef to (I). (A) are used for prevention, diagnosis (by specific detection of intraand/or extra-callular Nef, including staging of infection), and/or treatment of infections with human immune deficiency virus (HIV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   112 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 171

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a His-tagged Nef protein of HIV. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat. HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              172 QEEEEVGFPVTPQVPLRPMTYKAAVDLSHFLKEKGGLEGLIHSQRRQDILDLWIYHTQGY 231

                                                                                                                                                                                                                                                                                                                                                                         The nef protein comprises peptides which are expressed in vivo in HIV infected patients before detectable amts. of p25, gpl10 and gp41 are expressed. Thus, they can be used in assays for early detection of HI They can also be used to raise antibodies for use in detection, to induce cellular immunity or to raise neutralising antibodies that either inactivate the AIDS virus or reduce the viability of the virus in vivo or destroy infected cells. The peptides may be used in viral vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     172 QEEEEVGFPVTPQVPLRPMTYKAAVDLSHFLKEKGGLEGLIHSQRRQDILDLWIYHTQGY 231

This invention describes a novel retroviral packing cell (I), comprising the retroviral genes gag, pol and glycoproteins GP-1 and GP-2 of the LCMV coding gene gp, or a part of these. The products of the invention have anti-HIV and cytostatic activity and can be used for gene therapy. (I) is useful for in vitro infection of cells, especially hematopoletic stem cells, for expression of transgenes in cells and as a pharmaceutical carrier for gene therapy. (I) is therefore useful in the treatment of infectious diseases (HIV or AIDS), neoplasms (carcinomas), melanomas and other diseases. This sequence represents the Human immunodeficiency virus (HIV-1) nef protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New retroviral packing cell useful as pharmaceutical carrier in gene therapy for treatment of HIV and neoplasms, comprises retroviral genes and glycoproteins –
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             291
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          112 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 171

```
A comparison of AAN60287 with the cDNA of the HTLV-III genome revealed one particular clone, designated p7.11 which contained a DNA sequence encoding this peptide (AAP60308) sequence. This approx. 2.2 kilobase covers the precursor gay region and encodes, 5' to 3', p-12, p-15, p-24 a second p-15 protein, and approx. 300 extra base pairs 3' to the gag region (see AAN60288).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   112 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 171

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The inventors claim a polypeptide which is recognised by sera of human origin contg. antibodies against the virus of lymphadenopathies (LAV) or acquired immune deficiency syndrome ATDS). Also claimed are various peptides corresp. to the AA sequences deducible from proteins encoded by LAV DNA, defined by specific residues (e.g. 12-32, 37-46, 49-79, 88-153) in accordance with a formula given in the specification.

This invention describes a novel fusion polypeptide which comprises (a) a first polypeptide sequence of an AIDS associated E', env, or gap polypeptide, that specifically binds complementary antibody and (b) a second polypeptide sequence which is not an AIDS associated virus polypeptide. Also described are are (1) a fusion polypeptide having a herpes simplex virus (HSV) gD signal peptide sequence fused in reading frame with a polypeptide sequence other than HSV gD, (2) a nucleic acid encoding a fusion polypeptide as in (1); (3) an expression vector comprising a nucleic acid as in (2); (4) a host comprising a vector as in (3). The AIDS-associated fusion polypeptides can be used in the detection of and vaccination against viral etiological agents of AIDS. They can also be administered as a pharmaceutical agent to inhibit infection by AIDS associated retrovirus or dissemination of such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 112 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 171

the procession vector, and a DNA molecule containing a codon optimised open reading frame encoding a Nef protein or its immunogenic derivative. The Nef protein or its derivative is expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful for inducing a cell mediated immune (cytotoxic T lymphocyte, CTL) response against infection or disease caused by virulent strains of HIV, preferably human. It is also useful for lowering transmission rate to previously uninfected individuals and/or for reducing levels of viral conservation in infected individuals and/or for reducing transmission rate to previously uninfected individuals and/or for reducing levels of viral or lower with the present sequence is human immunodeficiency virus-1 (HIV-1) iffl Nef protein. The different codon optimised nef constructs of the invention are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel DNA vaccine useful for inducing cell mediated immune response against virulent strains of HIV, comprises DNA expression vector, and DNA containing codon optimized open reading frame encoding Nef protein
                                                                                                                                                                                                                                                                                                       DNA vaccine; codon optimisation; Nef protein; HIV infection; anti-HIV; cell mediated immune response; cytotoxic T lymphocyte; CTL; human immunodeficiency virus-1; HIV-1; mutant; mutein.

This sequence represents a protein of unspecified function contained in a complete nucleotide sequence of ARV-2 derived from partial sequences of several ARV clones. The invention provides a method for construction of a vector for expression of a polypeptide in a mammalian cell, comprising a polypeptide coding sequence operably linked downstream of an enhanced promoter. The enhanced promoter comprises the human cytomegalovirus immediate early region (HGW IEL) promoter. The polypeptide can be any of the HIV recombinant polypeptides and especially HIV gpl20. Expression of HIV gpl20 by COS 7 cells transfected with pCMV6a containing the gpl20 coding region, where pCMV6a is a vector containing the above enhanced promoter,

given in AAZ90201). The immunogenic pol fragment is not immunologically. Cross- reactive with human T cell lymphotropic viruses I or II. The invention also encompasses the used of p31 as an antigen. The recombinant antigens may be produced in Escherichia coli, Saccharomyces cerevisiae or in mammalian cells. Immunoassays using the recombinant HIV proteins may be used to diagnose and stage HIV-1 infections. Sequences AAY77294-Y77299 represent proteins encoded by the genome of HIV-1 (ATCC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "Wild type myristylation site at Gly2 substituted

capression vector, and a DNA molecule containing a codon optimised open reading frame encoding a Nef protein or its immunogenic derivative. The reading frame encoding a Nef protein or its immunogenic derivative. The Nef protein or its derivative is expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful for Inducing a cell mediated immune (cytcoxic T lymphocyte, CTL) response against infection or disease cused by virulent strains of HIV, by administering the DNA vaccine into the tissue of the vertebrate host, preferably human. It is also useful for lowering transmission rate to previously uninfected individuals and/or for reducing levels of viral loads within an infected individual, so as to prolong the asymptomatic phase of HIV infection. The present sequence is human immunodeficiency virus-1 (HIV-1) jifil Nef (G2A, LLAA) mutant protein. The different nef constructs of the invention are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ä
Novel DNA vaccine useful for inducing cell mediated immune response against virulent strains of HIV, comprises DNA expression vector, and DNA containing codon optimized open reading frame encoding Nef protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               161

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                The present invention relates to a DNA vaccine comprising a DNA expression vector, and a DNA molecule containing a codon optimised open reading frame encoding a Nef protein or its immunogenic derivative. The Nef protein or its immunogenic derivative. The Nef protein or its derivative is expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful for inducing a cell mediated immune (cytotoxic T lymphocyte, CTL) response against infection or disease caused by virulent strains of HIV, by administering the DNA vaccine into the tissue of the vertebrate host, preferrably human. It is also useful for lowering transmission rate to previously uninfected individual, so as to prolong the asymptomatic loads within an infected individual, so as to prolong the asymptomatic activator (tPA) leader peptide-human immunodeficiency virus-1 (HIV-1) irfl Nef (opt tpanef) chimaric mutant protein. The mutation include deletion of the myristylation site (Gly2) in the HIV-1 jifl Nef protein. The different codon optimised nef constructs of the invention are used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA vaccine; codon optimisation; Nef protein; HIV infection; anti-HIV; cell mediated immune response; cytotoxic T lymphocyte; CTL; human immunodeficiency virus-1; HIV-1; human; jrfl nef; opt tpanef; tissue plasminogen activator; tPA; chimeric protein; mutant; mutein.

The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     B human immunodeficiency

                                         This invention describes a novel polynuclectide isolated from human immunodeficiency virus type 1 subtype C/B' which can be used for the polypeptides (il) encoded by them, are useful in pharmaceuticals, vaccines and diagnostic agents, particularly for treatment or prevention of human immune deficiency virus 1 (HIV-1) infections, also for rational design of test or therapeutic reagents, or gene therapy vectors. Polypeptides, especially antibodies, specifically directed against (II) are similarly useful as pharmaceutical and diagnostic agents (I) are specific for intersubtype C/B' of HIV-1 so are useful in regions (particularly China and South-East Asia) where this subtype is prevalent. The products of the invention have antiviral activity. This sequence in represents a procedule by the HIV-1 subtype C genome described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2842

nef protein - human immunodeficiency virus type 1 (strain YU-2)

N;Alternate names: 3'-orf protein; orf-F protein
C;Species: human immunodeficiency virus type 1, HIV-1
A;Note: host Homo saptens (man)
C;Date: 31-Dec-1993 #sequence_revision 31-Dec-1993 #text_change 23-Feb-1997
C;Accession: I44001
R;Li, Y; Hui, H; Burgess, C.J; Price, R.W.; Sharp, P.M.; Hahn, B.H.; Shaw, G.M.
J, Virol. 66, 6587-6600, 1992
A;Title: Complete nucleotide sequence, genome organization, and biological properties
                                                                                                                                                                                                                                                                             A, Accession: 144001
A, Molecule type: DNA
A, Residues: 1-214 <LIV3
A, Cross references: GB:M93258
C; Genetics: 3'-orf; orf-F
C; Superfamily: AlDS nef protein
C; Keywords: AlDS; immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

R; Janson, H.: Heden, L.O.: Grubb, A.: Ruan, M.: Forsgren, A.
A; Title: Protein D, an immunoglobulin D-binding protein of Haemophilus Influenzae: Clay Molecule type: DNA
A; Reference number: A43576
A; Molecule type: DNA
A; Residues: 1-364 < JANA
A; Residues: 1-364 < JANA
A; Residues: 1-364 < JANA
A; Experimental source: Isolate 772
C; Keywords: lipoprotein; phosphoric diester hydrolase; |surface antigen F; 1-18/Domain: signal sequence #status predicted <SiG>C; Keywords: lipoprotein; phosphodiester phosphodiesterase #status predicted <MAT>F; 19-364/Product: glycerophosphodiester phosphodiesterase #status predicted <MAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Withernate names: immunosiobulin D-binding protein; protein D

C. Species: Haemophilus influenzae

A:Variety: strain Eagan; strain HK695

C:Accession: S59934; S59935; S47336; S47337

C:Accession: S59934; S59935; S47336; S47337

R:Song, X.M.; Forsgren, A.; Janson, H.

Infect. Immun. 63, 696-699, 1995

A:Title: The gene encoding protein D (hpd) is highly conserved among Haemophilus inf. A:Reference number: S59931; MUID:95122210

A:Reference number: S59931; MUID:95122210
